

Generate this as a single rendered poster image (JPEG or PNG, A3 landscape, 420mm x 297mm, high resolution, print-ready) — not HTML, CSS, SVG, or any code. Output the finished poster graphic directly.

Use the attached poster image as the exact visual template:

same navy blue and light-blue color scheme,

same rounded panel layout with pill-shaped navy title bars,

same icon style,

same overall structure.

Read my attached project report and extract the real content for each section below — do not invent data, numbers, or findings that aren't in the report.

For every panel, condense the report's content into a short, meaningful summary that fits the panel (2-4 sentences or 3-5 bullet points, matching what's shown in the template) — do not paste long raw paragraphs from the report; rewrite them as concise, poster-appropriate summaries.

Header:

Do NOT attempt to extract, redraw, or recreate any logos from the attached reference image — image models cannot reliably copy an embedded logo and will distort it. **Instead, leave two clean empty rectangular spaces in the exact same header positions as the reference image: a small placeholder box in the top-left corner (for the institution logo) and a small placeholder box in the top-right corner (for a department/sponsor logo),** each with a thin dashed border and no content inside.

Institution name, department, and location from the report (or leave as placeholder text if not present)

Course name and academic year from the report

Full project title from the report, in large bold text below the header band

Panels to generate, using report content:

ABSTRACT — summarize the report's abstract/summary section in 3-4 sentences: what problem is solved, what method is used, what the outcome is.

INTRODUCTION — summarize the report's introduction/background in 3-4 sentences: why the problem matters and what approach is taken.

OBJECTIVES — pull the stated objectives/goals from the report and condense into 4-5 short bullet points.

METHODS & MATERIALS — extract the actual pipeline/workflow stages from the report's methodology section and lay them out as a left-to-right sequence of icon

boxes connected by arrows (e.g., **System Design** → **Java Development** → **Data Handling(ArrayList, HashSet, HashMap/TreeMap and other Java Collections)** → **Module Integration** → **Testing & Evaluation** using the report's real stage names),

SYSTEM ARCHITECTURE — build a simple boxes-and-arrows diagram of the system's actual components and data flow as described in the report (Requirement Analysis → System Design → Java Class & Module Development → Data Processing & Validation → Module Integration), using the report's own component names.

RESULTS — pull actual numbers from the report's results section: recreate any result images if provided, and rebuild the report's real performance table or whatever metrics the report uses with the best-performing method's row highlighted. If the report includes charts recreate simplified versions of those exact charts using the report's real values — do not fabricate plausible-looking curves if the report doesn't provide the underlying numbers; in that case, only include the ones you have real data for.

DISCUSSION — condense the report's discussion section into 3-4 bullet points: key findings, practical usefulness, limitations.

CONCLUSION — condense the report's conclusion into 3-4 bullet points: what was achieved and its impact.

FUTURE ENHANCEMENTS — pull the report's future work section into 3-5 short bullet points.

REFERENCES — list 4-5 of the report's actual citations, shortened to fit small text (authors/source + year, not full citations).

PROJECT TEAM — leave as a numbered blank list (1-5) with a "Faculty Guide: _____" line, unless the report names the students and guide, in which case fill them in.

Visual style (match the attached template exactly): navy blue header bars and panel title pills, white text on navy, very light blue background, teal/cyan accent color for charts and the highlighted best-result row, dark gray body text, bold sans-serif headers, clean sans-serif body text, flat vector icons relevant to the project's actual domain (not necessarily the dental/tooth icons in the reference — swap icons to match this project's subject), rounded-corner panels, consistent padding and font sizes across all panels so the poster reads as one coherent document.
